

TISSUE VIABILITY

AT RISK PATIENT

Harms – New or Existing
Pressure Ulcers, CAUTIs, VTEs, Falls

Pressure Ulcer
Localised injury to the skin and/or underlying tissue usually over a bony prominence, as a result of pressure, or pressure in combination with shear
– European Pressure Ulcer Advisory Panel / National Pressure Ulcer Advisory Panel (2014)

Prevention is better (and less costly) than cure
Maintain skin integrity – intact skin will protect against infection

ASKING

A	Assess Pressure Ulcer Risk (Waterlow for adults) and other risks
S	Skin assessment and skin care
S	Surfaces /Equipment
K	Keep moving/ Reposition
I	Incontinence
N	Nutrition
G	Giving information

S – Skin Assessment

Skin inspection should:

- be completed within 6 hours of admission to hospital/ward/unit including transfers between wards. ALL dressings removed and wounds assessed
- occur regularly and the frequency determined as a response to changes in the individuals condition.
- Include assessment of vulnerable areas

Document findings: Body map wounds/pressure/moisture damage.
Medical photography X64139 Handover.

WATERLOW

POSTURE	HEAVY DRESSING	MOISTURE	FRAGILE SKIN	IMMOBILITY	WEIGHT	AGE	HAIR	SCAR TISSUE	PREVIOUS PRESSURE ULCERS	PREVIOUS SURGICAL TREATMENT	PREVIOUS TRAUMA	PREVIOUS BURNS	PREVIOUS INFECTIONS	PREVIOUS RADIATION	PREVIOUS CHEMOTHERAPY	PREVIOUS DRUGS	PREVIOUS MEDICATIONS	PREVIOUS SURGICAL TREATMENT	PREVIOUS TRAUMA	PREVIOUS BURNS	PREVIOUS INFECTIONS	PREVIOUS RADIATION	PREVIOUS CHEMOTHERAPY	PREVIOUS DRUGS	PREVIOUS MEDICATIONS
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Start ICP if Waterlow is 10 or more
OR patient has existing pressure ulcers
OR patient has a history of pressure ulcers
Reassess Weekly or following change in patients condition and on transferring to other units

Skin Assessment

Health care professionals should be aware of the following

- Persistent erythema
- Non-blanching hyperaemia
- Blisters
- Discolouration

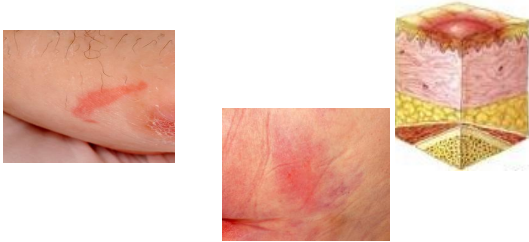

Feel for:

- Localised heat
- Localised oedema
- Localised induration

Note: on darker pigmented skin visually damage may appear more purple in colour.

Grade / Category 1

Category 1: Non-blanching erythema of intact skin. Discolouration of the skin, warmth, oedema, induration or hardness may also be used as indicators particularly on individuals with darker skin.

Grade / Category 2

Category 2: Partial thickness skin loss involving epidermis, dermis or both. The ulcer is superficial and presents clinically as an abrasion or blister.

Grade / Category 3

Category 3: Full thickness skin loss involving damage to or necrosis of subcutaneous tissue that may extend down to, but not through underlying fascia.

Grade / Category 4

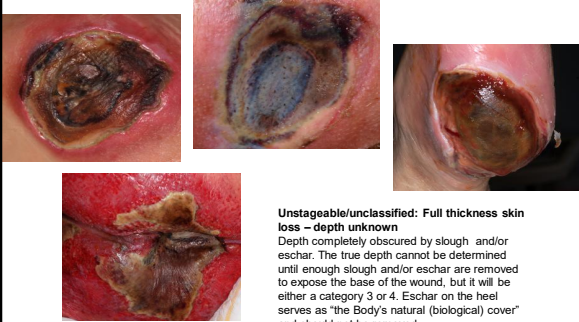

Category 4: Full thickness skin loss Extensive destruction, tissue necrosis, or damage to muscle, bone, or supporting structures with or without full thickness skin loss.

A grade 4 Pressure ulcer will **not** become a grade 3, 2, or 1. It will become a **healing** grade 4 pressure ulcer.

Why?
Because you don't replace the damage to the muscle, subcutaneous fat and dermis prior to epithelialisation.

Unstageable

Unstageable/unclassified: Full thickness skin loss – depth unknown
Depth completely obscured by slough and/or eschar. The true depth cannot be determined until enough slough and/or eschar are removed to expose the base of the wound, but it will be either a category 3 or 4. Eschar on the heel serves as "the Body's natural (biological) cover" and should not be removed.

Suspected Deep Tissue Injury (SDTI)

Suspected deep tissue injury – depth unknown
This is purple or maroon localised area of discoloured intact skin or blood-filled blister due to damage of the underlying soft tissue from pressure and/or shear.

Mucus Membrane Tissue Damage (MPru)

- Moist lining of body cavities communicating with exterior especially vulnerable especially related to medical devices
- Pressure can cause ischemic with ulcer formation
- These ulcers are not graded using the current system but reported as mucosal pressure ulcer damage.

Related devices:-

Oxygen tubing
Endotracheal tubes
Bite blocks
Nasogastric tubes
Urinary catheters
Faecal containment devices

Medical Device Related Pressure Ulcers

Other things to consider:

Skin Assessment and Skin Care

• Anal cleft

• Diffuse Spots

Moisture Associated Skin Damage (MASD)

Often mistaken for pressure damage.
Treatment: Good skin hygiene

• Kissing Ulcer

Stop the Pressure:
Moisture + Pressure = Accelerated skin damage
Combination Ulcer:

PRESSURE ULCERS vs MOISTURE LESIONS

PRESSURE ULCERS	MOISTURE LESIONS
<ul style="list-style-type: none"> • Circular/ Regular shape • Distinct edges • Pressure / shear present • Localised over Bony prominence, site of mucous membrane cavity or evidence of medical device • Can be deep • Necrotic tissue can be present 	<ul style="list-style-type: none"> • Diffuse shape, may have several skin breaks • May have irregular or jagged edges • Moisture: urine, faeces, sweat, exudate • Sites associated with moisture - Sacrum, skin folds, wound margins • Shallow • Necrotic tissue not present

Skin Care

- Keep skin clean and supple
- Use wipes to cleanse the skin
- Pat dry with a towel if required
- Apply a moisturiser for general skin care or barrier product if the patient has continence issues

Derma S Cream

Protection from incontinence & dry areas

Derma S Sticks or Spray

Broken Skin

SURFACES- EQUIPMENT

Mattresses:
Pressure reduction - Static Mattresses
Pressure relief - Dynamic Mattresses

KerraPro Pressure Reducing Pads

- Range of shaped, silicone pads
- Dissipates pressure
- Hardwearing, flexible and lightweight
- Stable, maintains shape and odourless

KerraPro

K – Keep Moving

- Encourage mobility and self repositioning. Get patients up and out – good for mood, address any pain needs.
- Slide sheets or Hoist into chair – consider correct surface.
- Reposition as risk assessment guides e.g. 2, 4hourly - document
- Off loading of patients pressure areas with damage
- Liaise with other specialities /discharge planning
- Time spent in bed, off loading of pressure to vulnerable/ damaged areas.

I – Incontinence

Increased moisture on skin, accelerates skin breakdown and breeds bacteria. Urine and faeces burn the skin.

- Commence protecting skin with barrier cream before damage when patient is incontinent.
- Regular pad checks and repositions – correct sizing of pad. Only 1 pad is required
- Cleanse skin with aqueous cream dissolved in water.
- Complete documentation

N – Nutrition

Nutrition is key in wound healing and skin integrity.

- Encourage good diet and fluids.
- If poor intake/ patient at risk commence nutritional supplements.
- Ensure MUST assessment completed.

G – Giving information

- Communicating concerns with patient, relatives and MDT.
- Does the patient have capacity?
- Is the patient and relatives aware of the risks of pressure/tissue damage?
- Are they aware of the importance of the advised interventions?
- Are there safeguarding concerns?
- Escalate and document non concordance/ variations in care.
- Mental capacity assessment if non-concordant
- Pressure ulcer leaflet.

When to Report pressure ulcers on ULYSSES

All pressure ulcers and moisture damage must be reported

NB Check wound with senior nurse before instigating incident if uncertain of Category.

1. NEW pressure ulcers
2. Deterioration of a pressure ulcer – e.g. – category 2 increases to Category 3.
3. Existing pressure ulcers

Known and previously reported pressure ulcers/ wounds do NOT need to be re-reported on admission to your area.

WOUND ASSESSMENT - TIME

- Wound assessment chart to document assessment of the wound and plan of care.
(NB Only Pressure ulcers are categorised)

TIME

- T - Tissue
- I - Infection /Inflammation
- M - Moisture balance
- E - Edges
- Other considerations – e.g. Pain
